

ABSTRACT OF THE DISCLOSURE

[0039] A system for measuring quality of a digital network having a controller, a test dialer, a network component, and a testing function resident on the network component. The network component is remote from the test dialer and the controller. The network component communicates with the controller and the test dialer over the digital network. The controller controls the test dialer and the testing function to determine a voice quality, a call completion quality, a load capability quality, and any combinations thereof.
